

AUTOMATED ASSET MANAGEMENT

Land Management

Effective land management protects oil and gas companies against excess surface use fees and erroneous damage claims. Providing stakeholders with a objective common operating picture reducing misunderstanding and facilitates coordination. Models built with remotely sensed data can be leveraged across the entire lifecycle.

Land Ownership

Environmental Condition

Infrastructure Locations

Activity Monitoring

Change Detection

1 Juniper Unmanned uses remote sensing technologies to create highly accurate models of the terrain, and infrastructure.

2 The models are used to create products like habitat maps, video fly-throughs, land surveys, infrastructure locations, contour maps, line of sight, and property boundaries.

3 We will analyze data with the power of artificial intelligence and display the results on a secure cloud-based platform. Juniper Unmanned takes care of the data management, the analytic tools, and the integration with your existing systems for one low subscription price.
