SAFETY AND RELIABILITY

Systems Inspection

Having a program that collects the right data, analyzes for encroaching vegetation, damaged equipment, and nearby hazards, and connects back to daily business processes like inspection, scheduling and maintenance is the future of automated wildfire risk mitigation. Our UAV aerial inspections incorporate fire risk considerations and inspection methodologies developed to promote safety and reliability throughout your service

1 Juniper Unmanned uses drones, equipped with visual, thermal and LiDAR sensors. Our operators are specially trained to follow the stringent safety guidelines and confidentiality policies of most utilities.

2 The data is then analyzed to provide early warning indicators of wildfire risk. Juniper Unmaned takes care of the data management, the analytic tools, and the integration with your existing systems.
